Introduction

Problem

Our goal is to explore, analyze and model a dataset containing information on approximately 12,000 commercially available wines. The variables are mostly related to the chemical properties of the wine being sold. The response variable is the number of sample cases of wine that were purchased by wine distribution companies after sampling a wine. These cases would be used to provide tasting samples to restaurants and wine stores around the United States. The more sample cases purchased, the more likely is a wine to be sold at a high end restaurant.

A large wine manufacturer is studying the data in order to predict the number of wine cases ordered based upon the wine characteristics. If the wine manufacturer can predict the number of cases, then that manufacturer will be able to adjust their wine offering to maximize sales.

The objective is to build a count regression model to predict the number of cases of wine that will be sold given certain properties of the wine.

Data Exploration

Below we'll display a few basic EDA techniques to gain insight into our wine dataset.

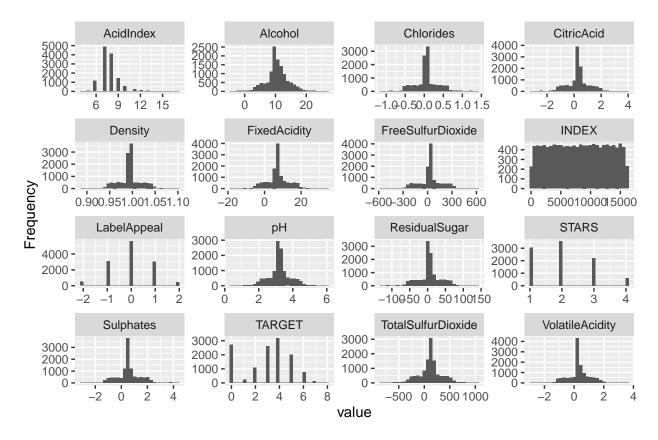

Basic Statistics

The data is 1.3 Mb in size. There are 12,795 rows and 15 columns (features). Of all 15 columns, 0 are discrete, 15 are continuous, and 0 are all missing. There are 8,200 missing values out of 191,925 data points.

##		n	mean	sd	median	min	max	skew
##	INDEX			4656.91			16129.00	0.00
##	TARGET	12795	3.03	1.93	3.00	0.00		-0.33
	FixedAcidity	12795	7.08	6.32	6.90		34.40	
	VolatileAcidity	12795	0.32	0.78	0.28	-2.79	3.68	0.02
	CitricAcid	12795	0.31	0.86	0.31			-0.05
	ResidualSugar	12179		33.75		-127.80		
	Chlorides	12157	0.05	0.32	0.05	-1.17	1.35	0.03
	FreeSulfurDioxide	12148	30.85	148.71		-555.00	623.00	0.01
##	TotalSulfurDioxide		120.71	231.91		-823.00		
	Density	12795	0.99	0.03	0.99	0.89		-0.02
	рН	12400	3.21	0.68	3.20	0.48	6.13	0.04
	Sulphates	11585	0.53	0.93	0.50	-3.13	4.24	0.01
	Alcohol	12142	10.49	3.73	10.40	-4.70	26.50	-0.03
##	LabelAppeal	12795	-0.01	0.89	0.00	-2.00	2.00	0.01
	AcidIndex	12795	7.77	1.32	8.00	4.00	17.00	1.65
##		kurtos	sis					
##	INDEX	-1	. 20					
##	TARGET	-0	.88					
##	FixedAcidity	1	. 67					
##	VolatileAcidity	1	.83					
##	CitricAcid	1	.84					
##	ResidualSugar	1	.88					
##	Chlorides	1	.79					
##	FreeSulfurDioxide	1	. 84					
##	${\tt TotalSulfurDioxide}$	1	. 67					
##	Density	1	. 90					
##	рН	1	. 65					
##	Sulphates	1	.75					
##	Alcohol	1	. 54					
##	LabelAppeal	-0	. 26					
##	AcidIndex	5	. 19					

It's useful to note a couple of things right off the bat with regard to our dataset: - There are several variables that have negative values. - ResidualSugar, Chlorides, FreeSulfurDioxide, and TotalSulfurDioxide all have quite a few missing values that we are going to need to deal with in order to assess the variables. - The Index column is useless and can be ignored.

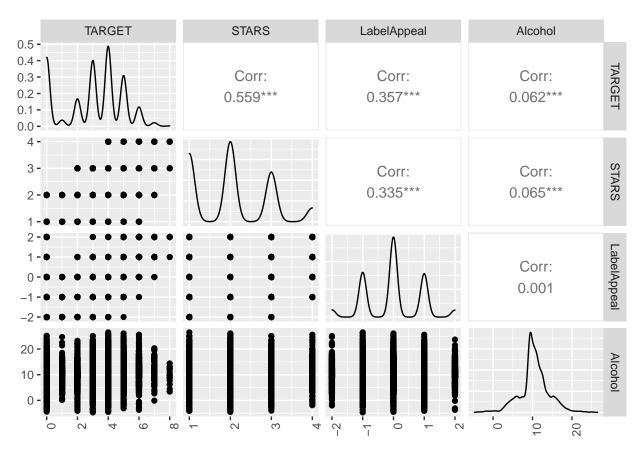

Histogram of Variables

Based on the histograms we can see that a lot of the variables distributions looks to be a normal distribution. We can see that **AcidIndex**, **STARS**, and **TARGET** are a bit skewed. One thing to note is that the **TARGET** variable has a lot of 0 cases sold. These 0 **TARGET** variables will need to be cleaned during the data prep phase as they can skew the results of the model.

Relationship of Predictors to Target

It is useful to assess the plots of each variable against the target variable. Using the GGPairs function from GGally we can plot someof the variables of interest to see if any of the variables correlates with the response variable **TARGET**. We will be making sure to include the variables **STARS** and **LabelAppeal** as it is believed that these two variables affect sales numbers

We can see that **STARS** and **Alcohol** has a bit of correlation with **TARGET**.

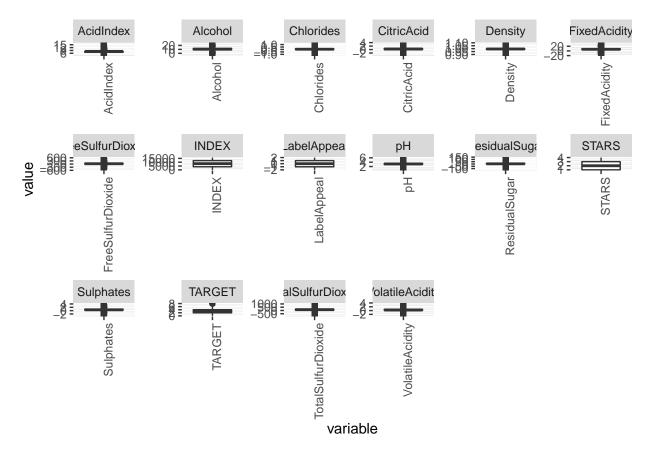

Boxplots

After observing our distributions, we can next assess the variables' relationship with our target variable (TARGET). It would be useful to establish the

```
bp_train <- train_data %>%
  gather(key = 'variable', value = 'value')

ggplot(bp_train, aes(variable, value)) +
  geom_boxplot() +
  facet_wrap(. ~variable, scales='free', ncol=6)
```

Warning: Removed 8200 rows containing non-finite values (stat_boxplot).

When looking at the boxplot for **TARGET** we can see a very different picture compared to looking at the histogram. In the histogram it shows all the 0 **TARGETS** which can skew the modeling results while in the histogram one can not easily point that out. This is the reason why we need to look at the data in mulitple different ways.

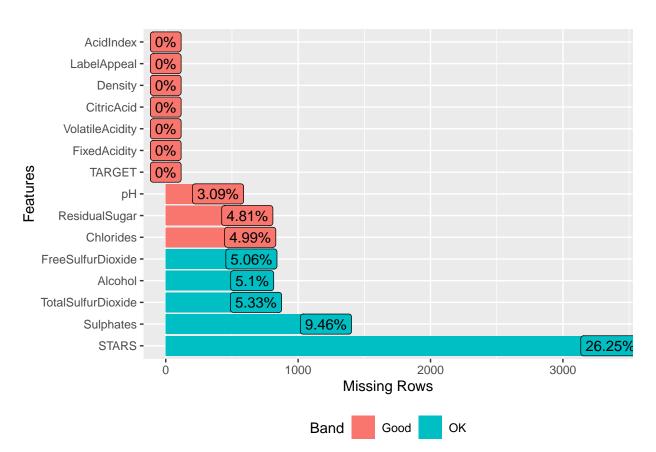

Data Preparation

Identify Missing Values

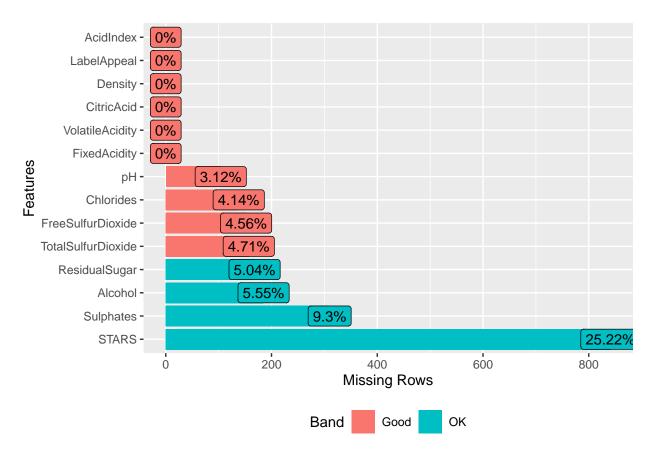

We can see that the same variables for both train data set and evaluation data set contains missing values. The variable that contains the most missing values is the **STAR** followed by **Sulphates**, **Alcohol**, **ResidualSugar**, **TotalSulfurDioxide**, **FreeSulfurDioxide**, **Chlorides**, and **pH**.

##		Train Data Set Variales	Missing	Count
##	1	TARGET	•	0
##	2	FixedAcidity	τ	0
##	3	${\tt VolatileAcidity}$	7	0
##	4	CitricAcio	l	0
##	5	ResidualSugar	:	616
##	6	Chlorides	3	638
##	7	FreeSulfurDioxide)	647
##	8	TotalSulfurDioxide)	682
##	9	Density	τ	0
##	10	lα	I	395

##	11	Sulphates	1210
##	12	Alcohol	653
##	13	LabelAppeal	0
##	14	${\tt AcidIndex}$	0
##	15	STARS	3359

##		Train	Data	Set	Variales	Missing	Count
##	1				TARGET		3335
##	2			Fixe	edAcidity		0
##	3		Vol	[ati	LeAcidity		0
##	4			C	itricAcid		0
##	5		F	Resid	dualSugar		168
##	6			(Chlorides		138
##	7		FreeS	Sulfu	ırDioxide		152
##	8	7	[otals	Sulfu	ırDioxide		157
##	9				Density		0
##	10				pН		104
##	11			5	Sulphates		310
##	12				Alcohol		185
##	13			Lab	oelAppeal		0
##	14			I	AcidIndex		0
##	15				STARS		841

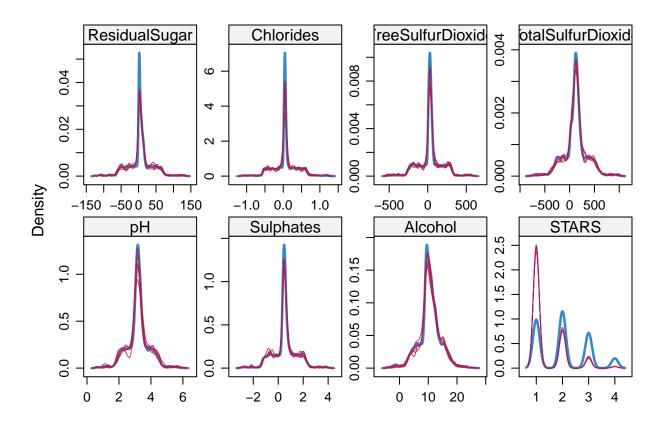

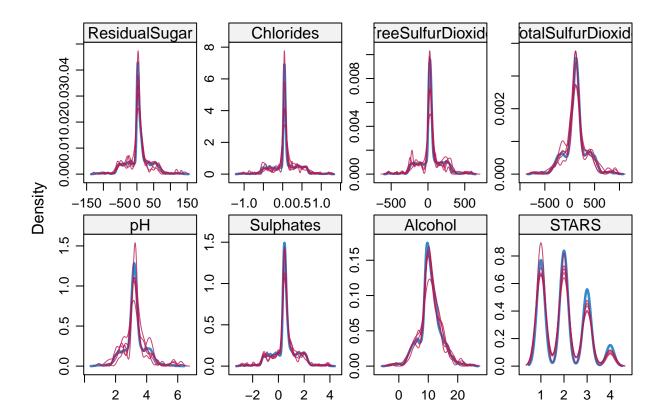

Our chart above does a good job of highlighting the missing values that will no doubt impact our analysis if we don't deal with them. In particular:

- \bullet STARS is missing 25% of its records. We could guess that the wines haven't been assessed and rated by experts.
- Sulphates is missing 9% of its records.
- Alcohol is missing 5% of its records. It is unlikely that a 0 here would indicate no alcohol in the wine, given that it's wine, so we can assume these values are missing.
- ResidualSugar is missing 5% of its records. There are some records that have 0 for ResidualSugar so these flagged records most certainly have missing values.
- A few more variables experiences missing values as well such as TotalSulfurDioxide (<5%), FreeSulfurDioxide (<5%), Chlorides (<5%), and pH (<4%).

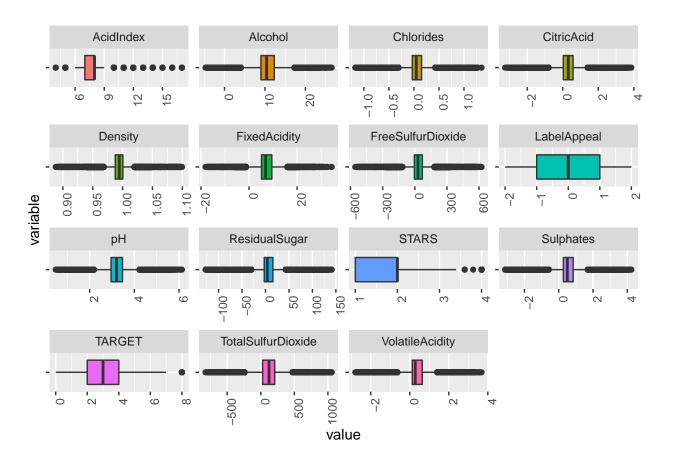

Impute Missing Values

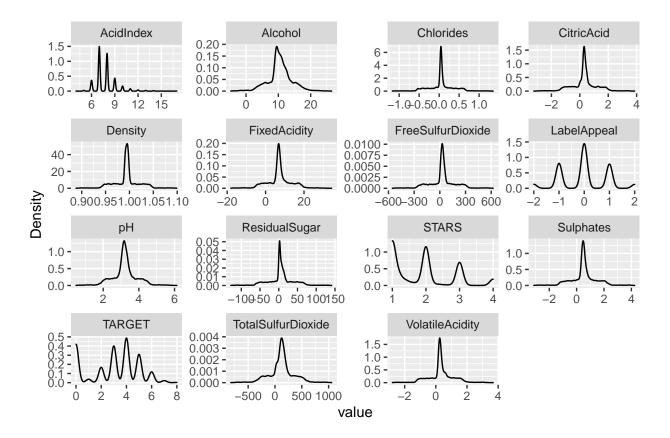

We assume the missing data are Missing at Random and choose to impute. The reason we want to impute the missing data rather than replacing with mean or median because of large number of missing values. If we're replacing with mean or median on the large number of missing values, can result in loss of variation in data. We're imputing the missing data using the MICE package. The method of predictive mean matching (PMM) is selected for continuous variables.

Next, we take average values of the 5 imputed data set as a final train data set used for building models.

Because we'll use the Poisson or Negative Binomial regression to build count regression models in GLM approach, transformation for each variable to make them looks normal is not required. Diagnostics of actual outliers or influential points can be identified in the build models section through plots such as residuals vs fitted, standardized residuals vs fitted, etc.

Identifying Multicollinearity

stack(sort(cor(complete_train_data[,1], complete_train_data[,2:ncol(complete_train_data)])[,], decreasing

                             AcidIndex
```

```
correlation = cor(complete_train_data, use = 'pairwise.complete.obs')
#corrplot(correlation, method='ellipse', type = 'lower', order = 'hclust',col=brewer.pal(n=8, name="RdY")
```

After our EDA and Data Prep, we can render some judgments on the dataset, including that there are some variables with a weak enough relationship with our TARGET that we can plan to drop them. We also need to plan on dealing with the many outliers that could skew our models and pay close attention to multicollinearity, especially as it relates to the relationship between STARS and LabelAppeal. These two features also happen to have the strongest correlation with the TARGET.

Build Models

Model Selection

To aid in model selection, let's test each of our models agains the holdout validation set.

```
"Baseline-Model",
                                 "quasi-Poisson-Model",
                                 "Negative-binomial-regression",
                                 "Zero-Inflated-Count-Models"),
                     MAE = c(getMAE(predict.lm(Model1, train_data)),
                             getMAE(predict.lm(Model2, train_data)),
                             getMAE(predict.lm(Model3, train_data)),
                             getMAE(predict.lm(Model4, train_data)),
                             getMAE(predict(Model5, train_data,
                                             type="response")),
                             getMAE(predict(Model6, train_data,
                                             type="response"))
                             ),
                     RMSE = c(getRMSE(predict.lm(Model1, train_data)),
                              getRMSE(predict.lm(Model2, train_data)),
                              getRMSE(predict.lm(Model3, train_data)),
                              getRMSE(predict.lm(Model4, train_data)),
                              getRMSE(predict(Model5, train_data,
                                             type="response")),
                              getRMSE(predict(Model6, train_data,
                                             type="response"))
)
knitr::kable(results)
```

Model	MAE	RMSE
Poisson1	NA	NA
Poisson2	NA	NA
Baseline-Model	NA	NA
quasi-Poisson-Model	NA	NA
Negative-binomial-regression	NA	NA
Zero-Inflated-Count-Models	NA	NA

Here we see a preference for our full zero-counts Model. We'll make our predictions using our the entire model.

summary(Model6)
